Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

[0001] The present invention relates generally to a cable television (CATV) decoder interface. More particularly, it relates to such an interface for connecting the cable television decoder to a television accessory, such as a video cassette recorder (VCR). Most especially, it relates to such an interface which maintains full functionality of the television accessory while connected to the decoder.

[0002] Cable television decoders typically operate by requiring a television set and a VCR connected to the decoder to be set to a predetermined channel, such as channel 2, 3 or 4, and all channel selection is accomplished by the decoder. This presents problems for unattended recording, in that not all of the advanced features available on state-of-the-art VCRs can be used while the VCR is under control of the decoder.

[0003] Two Zenith Electronics Corporation technical papers disclose systems which attempt to deal with this problem. Merrell, "Tac-Timer," 1986 NCTA Technical Papers, pp. 203-206, discloses a smart remote controller to solve the unattended programming problem when a cable decoder precedes a VCR. In lieu of programming the VCR, the smart remote controller is programmed to turn on a VCR at specific times to record desired programs. However, this remote controller does not coordinate channel selection for such devices as television schedule systems, such as disclosed in my U. S. Patent 4,706,121, issued November 10, 1987, nor does it support unique features of more advanced VCRs. For example, this controller does not support on-screen VCR programming, even if that feature is otherwise available on a VCR. The controller does not include any capability for conveying information about a channel selected on the cable decoder unit to a television schedule system or a VCR in any useful way.

[0004] Long, "The VCR Interface," 1986 NCTA Technical Papers, pp. 197-202, discloses two solutions for the unattended programming problem when a cable decoder precedes a VCR. The first of these is a VCR baseband decoder, also called BASE-TAC, and currently marketed by Zenith as MultiPort or MP. MPs allow the core functions (descrambling and addressing) of a cable decoder to be added to TVs and VCRs. The decoder accepts the baseband output of the TV or VCR tuner, eliminating the need for a separate decoder tuner and attendant need to coordinate two tuners. This method is effective for supporting television schedule systems and allows full functionality of advanced VCR features. However, the MP alternative requires new TV or VCR equipment and is not compatible with the existing installed base of cable decoders. This method has not been well-received at this time. The second is the VCR Interface, which uses RF switching and a centralized approach for all TVs and VCRs in the home. It descrambles incoming CATV channels and, after modulation, combines them back onto the CATV cable at unused upper

channels. The result is that any TV set on the cable can receive premium channels without a separate decoder. This method eliminates the need for redundant decoders at every TV set or VCR. As described, the system was conceived for only one premium channel. To support a television schedule system, all premium channels must be descrambled together and be available simultaneously. If not, it would be necessary to provide a way of tuning the centralized descrambler from any TV set or VCR attached to the cable. Such a scheme would be awkward when more than one TV or VCR competes for control of the single descrambler. The VCR interface may be implemented using retrofitted decoders, but the overall cost may be prohibitive for the average home.

[0005] A somewhat similar system for use with the German television networks is described in Sommerhauser, "Video Programm System: Flexibel programmieren mit VPS," Funkschau, No. 25, December 1985, pp. 47-51.

[0006] Other prior art relating to CATV, its decoders, and programmable remote devices includes West German Published Application 2,338,380, published February 13, 1975; U.K. Patent 1,554,411, published October 17, 1979; U.S. Patent 4,375,651, issued March 1, 1983 to Templin et al.; U.S. Patent 4,394,691, issued July 19, 1983 to Amano et al.; U.S. Patent 4,802,114, issued January 31, 1989 to Sogame-US-A-4841368 discloses a system in which a remote control transmitter is incorporated into a television receiver. While the prior art relating to cable decoder interfaces and similar devices is a well-developed one, a need remains for further development of such devices. None of the existing interfaces both provides a complete solution to the problem of unattended recording and is compatible with already installed equipment.

[0007] Accordingly, it is an object of this invention to provide a single tuning arrangement which will coordinate channel selection information between a cable decoder and a television schedule system, a VCR or any television device.

[0008] It is another object of the invention to provide such a tuning arrangement which is compatible with already installed equipment.

[0009] It is a further object of the invention to provide such a single tuning arrangement which preserves the advanced features of television devices when operating behind cable decoders.

[0010] Various aspects of the present invention are defined in the independent claims. Some preferred aspects are defined in the dependent claims.

[0011] The attainment of the foregoing and related objects, advantages and features of the invention should be more readily apparent to those skilled in the art, after review of the following more detailed description of the invention, taken together with the drawings, in which:

Figure 1 is a block diagram of a system for interfacing a cable television decoder to a television acces-

sory in accordance with the invention.

Figure 2 is a more detailed block diagram of the system shown in Figure 1.

[0012] Turning now to the drawings, more particularly to Figure 1, there is shown a system 10 for interfacing a cable television decoder 12 to a VCR 14 incorporating a television scheduling system of the type disclosed in my above-referenced issued U.S. Patent 4,706,121. As is conventional, the cable signal is supplied to the cable decoder 12 on cable 16, and the decoded output of the decoder 12 is supplied to the VCR 14 through cable 18 on a fixed channel. The decoded output on the fixed channel is also selectively supplied to a television set 19, as indicated at 21. The VCR 14 receives commands from its remote controller 20. A cable decoder remote control emulator 22 is connected at 23 between the VCR 14 and the cable decoder 12. All channel selection codes supplied to the VCR 14 by its remote controller 20 are converted by the remote control emulator 22 to command codes recognized by the cable decoder 12. The remote control emulator 22 also suppresses execution of the channel selection codes supplied to the VCR 14, in order to keep the VCR 14 tuned to the fixed channel on which the decoded cable signal is supplied.

[0013] When the cable decoder mode is selected, channel indicator 74 (Figure 2) of the VCR will show the channel selected by the cable decoder unit. There are two reasons for using the VCR 14 to display the channel number instead of the cable decoder 12: The cable unit may now be hidden from sight, which is desired by most users, and it provides improved infrared isolation of the VCR remote controller 20 signal from unwanted pickup by the cable decoder remote input 56 (Figure 2). The benefit of using the VCR 14 for channel display is that the cable decoder unit 12 can be made transparent to the user.

[0014] The remote control emulator 22 drives an infrared emitter, which is positioned in front of an infrared input on the cable decoder 12. Thus, the remote control emulator 22 replaces the conventional cable decoder remote controller. The user communicates with the system using the VCR remote controller 20. For the user, the system 10 appears to function in the same manner as would the VCR 14 connected to the TV 19 with no cable decoder 12 present. This means that all functions, including on screen programming and the TV schedule system, provided with the VCR 14 are fully functional and are operated uniformly by the user and interact with the user uniformly.

[0015] Further details of portions of the VCR 14 and the cable remote emulator 22 are provided in Figure 2. As indicated at 24, the remote emulator 22 is supplied together with the VCR 14. The VCR 14 includes a programmable tuner 26 connected to an RF modulator 28 by cable 30. The cable decoder 12 is connected to the programmable tuner 26 by the cable 18, and the RF modulator 28 is connected to the TV 19 by cable 32. The

remote controller 20 supplies its inputs to a remote receiver 34 in the cable remote emulator 22. The remote receiver 34 is connected to a central processing unit (CPU) 36 by line 38. The CPU 36 is implemented with a commercially available microprocessor integrated circuit, such as those available from Intel Corporation, Santa Clara, California or Motorola, Inc., Phoenix, Arizona. The CPU 36 is connected to a random access memory 44 and to a cable decoder code memory 46, which may be either a random access or a read only memory, by busses 48 and 50. The CPU 36 is connected to a remote driver circuit 52 by the line 23. The remote driver circuit 52 is connected to an infrared emitter 54, which is positioned in front of remote input 56 of the cable decoder 12. The CPU 36 is connected to the programmable tuner 26 through a latch 70 by lines 71 and 76 and to a channel display 74 by line 72. The latch 70 is also connected to the CPU 36 by line 58. The latch 70 allows the channel data to be shown on the display 74 to be separated from data which is supplied to the programmable tuner 26. Data is supplied to the programmable tuner 26 only when the latch is enabled on line 58.

[0016] In operation, the cable remote emulator 22 is either programmed to learn the cable decoder 12 remote controller codes in the conventional manner for teaching a remote controller to learn the commands of a foreign controller, which are then stored in the cable decoder code memory 46, or the memory 46 contains conversion codes stored in ROM for the more popular cable decoder 12 models. The TV schedule system, which also utilizes the CPU 36, is set to the cable mode by a command from the remote controller 20. This causes the programmable tuner 26, also forming part of the TV schedule system, to be non-responsive to the remote controller 20 channel commands, as a result of a suitable control signal on line 58, so that the tuner will remain tuned to the fixed channel for the cable decoder 12, typically channel 3 or 4. However, the channel commands are stored in memory 44. Whenever the TV schedule system requires channel information, it will refer to the stored channel information. For example, when the TV schedule system is opened, it will point to the channel currently being viewed/recorded. When a program is selected from the TV schedule system, the system will automatically generate codes recognizable by the cable decoder 12 to change the channel on the cable decoder 12. When a cable input is not being used, the latch 70 is enabled on line 58, so that channel commands on line 71 are supplied to the programmable tuner 26.

[0017] Remote controller 20 commands are infrared coupled to the CPU 36 and stored in memory 44. When the system 10 includes a cable decoder 12, all channel tuning commands from the remote controller 20 are inhibited in favor of cable decoder channel commands recognized by the cable decoder and produced by the CPU 36 through conversion from the channel tuning

commands. The conversion code is contained in a ROM, or a RAM if the system 10 has a "learn" mode. After a delay to prevent potential conflict of two infrared signals, the converted code is coupled to the cable decoder remote input 56 by the infrared emitter 54. The process of emulating codes recognizable by the cable decoder 12 is done in a conventional manner known in the art. All other commands from the remote controller 20 are acted upon in the system 10 unchanged.

[0018] It should now be apparent to those skilled in the art that a novel system for interfacing a cable television decoder to a television accessory capable of achieving the stated objects of the invention has been provided. The system and method provides a single tuning arrangement which will coordinate channel selection information between a cable decoder and a television schedule system, a VCR or any television device. The tuning arrangement is compatible with already installed equipment. The single tuning arrangement preserves the advanced features of television devices when operating behind cable decoders.

[0019] It should further be apparent to those skilled in the art that various changes in form and details of the invention as shown and described may be made. It is intended that such changes be included within the scope of the claims appended hereto.

Claims

1. A system (10) for unattended recording of television programs on a video recorder, the video recorder (14) being arranged to receive television signals from a cable decoder (12), the system including:
 - means for receiving a user input indicative of a selected television program on a television channel to be recorded at an activation time;
 - an emulator (22) for co-ordinating channel selection, the emulator (22) being responsive to the user input for emulating the said channel of the selected television program to produce a channel tuning command recognisable by the cable decoder (12) or the video recorder (14);
 - a memory (44) for storing the channel tuning commands and the desired activation time;
 - means for automatically transmitting the channel tuning command to the cable decoder (12) or the video recorder (14) at the activation time, and
 - means for automatically supplying recording commands to the video recorder (14) at said activation time.
2. A system (10) as claimed in claim 1, wherein said means for receiving a user input comprises a television schedule system.
3. A system (10) as claimed in any one of the preceding claims, wherein means for receiving comprise an infra-red receiver (34).
4. A system (10) as claimed in any one of the preceding claims, wherein means are provided for suppressing video recorder channel changing commands during recording of the selected program, thereby to keep the video recorder (14) tuned to the channel on which the selected television program is supplied.
5. A system (10) as claimed in any one of the preceding claims, wherein the means for automatically transmitting the channel tuning command to the cable decoder (12) or the video recorder (14) at the activation time and the means for automatically supplying recording commands to the video recorder (14) at said activation time comprise a microprocessor (36).
6. A system (10) as claimed in claim 5, wherein the video recorder (19) has a channel indicator and said microprocessor is configured to display a channel on said channel indicator corresponding to the channel tuning commands transmitted to said cable decoder (12) or the video recorder (14).
7. A system (10) as claimed in any one of the preceding claims, wherein the means for automatically transmitting the channel tuning command to the cable decoder (12) or the video recorder (14) at the activation time comprise an infra red transmitter.
8. A system (10) as claimed in any one of the preceding claims comprising a programmable tuning means (26) for receiving a selected channel on a fixed channel from the cable decoder (12), and for tuning to a desired television signal when the television channel selected is not supplied via the cable decoder (12).
9. A system (10) as claimed in claim 8, wherein the emulator (22) supplies television channel tuning commands to the programmable tuning means (26) when the television channel selected is not supplied, via the cable decoder (12).
10. A system (10) as claimed in any one of the preceding claims wherein the video recorder (14) is a video cassette recorder.
11. A method for unattended recording of television programs on a video recorder (14), the video recorder (14) being arranged to receive television signals from a cable decoder (12), the method comprising:

receiving a user input indicative of a selected television program on a television channel to be recorded at an activation time;
 emulating the said channel of the selected television program to produce a channel tuning command recognisable by the cable decoder (12) or the video recorder (14);
 storing the channel tuning commands and the desired activation time;
 transmitting the channel tuning command to the cable decoder (12) or the video recorder (14) at the activation time, and
 automatically supplying recording commands to the video recorder (14) at said activation time.

12. A method as claimed in claim 11, wherein said step of receiving a user input comprises using a television schedule system.

13. A method as claimed in claim 11 or claim 12, further comprising suppressing video recorder channel changing commands during recording of the selected program, thereby to keep the video recorder (14) to the channel on which the selected television program is supplied.

14. A method as claimed in any one of claims 11 to 13, wherein the steps of transmitting the channel tuning command to the cable decoder (12) or the video recorder (14) at the activation time and supplying recording commands to the video recorder (14) at said activation time are carried out using a microprocessor (36).

15. A method as claimed in claim 14 involving displaying a channel on a channel indicator of the video recorder (14), the channel corresponding to the channel tuning commands transmitted to said cable decoder (12) or the video recorder (14).

16. A method as claimed in any one of claims 11 to 15, wherein the step of automatically transmitting the channel tuning command to the cable decoder (12) or the video recorder (14) at the activation time comprises transmitting an infra red signal to the cable decoder (12) or the video recorder (14).

Patentansprüche

1. System (10) zum unbeaufsichtigten Aufnehmen von Fernsehprogrammen auf einem Videorecorder, wobei der Videorecorder (14) angeordnet ist, um Fernsehsignale von einem Kabeldecoder (12) zu empfangen, wobei das System einschließt:

Mittel, um eine Benutzereingabe zu empfan-

gen, die auf ein, auf einem Fernsehkanal gewähltes, zu einer Aktivierungszeit aufzunehmendes Fernsehprogramm schließen lässt, einen Emulator (22), um die Wahl des Kanals zu koordinieren, wobei der Emulator (22) auf die Benutzereingabe anspricht, um den Kanal des gewählten Fernsehprogramms zu emulieren, um einen Kanal-Abstimmungsbefehl zu erzeugen, der von dem Kabeldecoder (12) oder dem Videorecorder (14) erkannt werden kann, einen Speicher (44), um die Kanal-Abstimmungsbefehle und die gewünschte Aktivierungszeit zu speichern, Mittel, um den Kanal-Abstimmungsbefehl zu der Aktivierungszeit automatisch zu dem Kabeldecoder (12) oder dem Videorecorder (14) zu übertragen, und Mittel, um Aufnahmebefehle zu der Aktivierungszeit automatisch dem Videorecorder (14) zu liefern.

2. System (10) gemäß Anspruch 1, wobei das Mittel zum Empfangen einer Benutzereingabe ein Fernsehzeitplan-System aufweist.

3. System (10) gemäß einem der vorstehenden Ansprüche, wobei die Mittel zum Empfangen einen Infrarot-Empfänger (34) aufweisen.

4. System (10) gemäß einem der vorstehenden Ansprüche, wobei Mittel bereitgestellt sind, um Kanal-Änderungsbefehle des Videorecorders während der Aufnahme des gewählten Programms zu unterdrücken, um dadurch den Videorecorder (14) auf den Kanal abgestimmt zu halten, auf dem das gewählte Fernsehprogramm geliefert wird.

5. System (10) gemäß einem der vorstehenden Ansprüche, wobei das Mittel zum automatischen Übertragen des Kanal-Abstimmungsbefehls an den Kabeldecoder (12) oder den Videorecorder (14) zu der Aktivierungszeit und die Mittel zum automatischen Liefern von Aufnahmebefehlen zu dem Videorecorder (14) zu der Aktivierungszeit einen Mikroprozessor (36) aufweisen.

6. System (10) gemäß Anspruch 5, wobei der Videorecorder (19) eine Kanalanzeige aufweist, und wobei der Mikroprozessor konfiguriert ist, einen Kanal auf der Kanalanzeige zu zeigen, der den, zu dem Kabeldecoder (12) oder dem Videorecorder (14) übertragenen Kanal-Abstimmungsbefehlen entspricht.

7. System (10) gemäß einem der vorstehenden Ansprüche, wobei die Mittel zum automatischen Übertragen des Kanal-Abstimmungsbefehls zu dem Kabeldecoder (12) oder dem Videorecorder (14) zu

der Aktivierungszeit einen Infrarot-Sender aufweisen.

8. System (10) gemäß einem der vorstehenden Ansprüche, aufweisend ein programmierbares Abstimm-Mittel (26) um einen gewählten Kanal oder einen festen Kanal von dem Kabeldecoder zu empfangen, und um auf ein gewünschtes Fernsehsignal abzustimmen, wenn der gewählte Fernsehkanal nicht über den Kabeldecoder (12) geliefert wird. 5 10
9. System (10) gemäß Anspruch 8, wobei der Emulator (22) Fernsehkanal-Abstimmungsbefehle zu dem programmierbaren Abstimm-Mittel (26) liefert, wenn der gewählte Fernsehkanal nicht über den Kabeldecoder (12) geliefert wird. 15
10. System (10) gemäß einem der vorstehenden Ansprüche, wobei der Videorecorder (14) ein Videokassettenrecorder ist. 20
11. Verfahren zum unbeaufsichtigten Aufnehmen von Fernsehprogrammen auf einem Videorecorder (14), wobei der Videorecorder (14) angeordnet ist, um Fernsehsignale von einem Kabeldecoder (12) zu empfangen, wobei das Verfahren aufweist: 25

empfangen einer Benutzereingabe, die auf ein, auf einem Fernsehkanal gewähltes, zu einer Aktivierungszeit aufzunehmendes Fernsehprogramm schließen lässt, 30

emulieren des Kanals des gewählten Fernsehprogramms, um einen Kanal-Abstimmungsbefehl zu erzeugen, der von dem Kabeldecoder (12) oder dem Videorecorder (14) erkannt werden kann, 35

speichern der Kanal-Abstimmungsbefehle und der gewünschten Aktivierungszeit, übertragen des Kanal-Abstimmungsbefehls zu der Aktivierungszeit zu dem Kabeldecoder (12) oder dem Videorecorder (14), und 40

automatisches liefern von Aufnahmebefehlen zu der Aktivierungszeit zu dem Videorecorder (14). 45
12. Verfahren gemäß Anspruch 11, wobei der Schritt des Empfanges einer Benutzereingabe das Verwenden eines Fernsehzeitplan-Systems aufweist. 50
13. Verfahren gemäß Anspruch 11 oder 12, weiter aufweisend: unterdrücken von Kanal-Änderungsbefehlen des Videorecorders während der Aufnahme des gewählten Programms, um dadurch den Videorecorder (14) auf den Kanal abgestimmt zu halten, auf dem das gewählte Fernsehprogramm geliefert wird. 55
14. Verfahren gemäß einem der Ansprüche 11 bis 13,

wobei die Schritte des Übertragens des Kanal-Abstimmungsbefehls an den Kabeldecoder (12) oder den Videorecorder (14) zu der Aktivierungszeit und des Lieferns von Aufnahmebefehlen zu dem Videorecorder (14) zu der Aktivierungszeit unter Verwendung eines Mikroprozessors (36) ausgeführt werden.

15. Verfahren gemäß Anspruch 14, enthaltend zeigen eines Kanals auf einer Kanalanzeige des Videorecorders (14), wobei der Kanal zu dem Kabeldecoder (12) oder dem Videorecorder (14) übertragenen Kanal-Abstimmungsbefehlen entspricht.
16. Verfahren gemäß einem der Ansprüche 11 bis 15, wobei der Schritt des automatischen Übertragens des Kanal-Abstimmungsbefehls zu dem Kabeldecoder (12) oder zu dem Videorecorder (14) zu der Aktivierungszeit das Übertragen eines Infrarot-Signals zu dem Kabeldecoder (12) oder dem Videorecorder (14) aufweist.

Revendications

1. Système (10) pour l'enregistrement sans surveillance de programmes de télévision sur un enregistreur vidéo, l'enregistreur vidéo (14) étant propre à recevoir des signaux de télévision d'un décodeur TV (12), le système comprenant :

un moyen pour recevoir une entrée utilisateur indicative d'un programme de télévision sélectionné sur un canal de télévision à enregistrer à une heure d'activation ;

un émulateur (22) pour coordonner la sélection de canal, l'émulateur (22) réagissant à l'entrée utilisateur pour émuler ledit canal du programme de télévision sélectionné pour produire une commande d'accord de canal reconnaissable par le décodeur TV (12) ou l'enregistreur vidéo (14) ;

une mémoire (44) pour mémoriser les commandes d'accord de canal et l'heure d'activation souhaitée ;

un moyen pour transmettre automatiquement la commande d'accord de canal au décodeur TV (12) ou à l'enregistreur vidéo (14) à l'heure d'activation, et

un moyen pour fournir automatiquement des commandes d'enregistrement à l'enregistreur vidéo (14) à ladite heure d'activation.
2. Système (10) suivant la revendication 1, dans lequel ledit moyen pour recevoir une entrée utilisateur comprend un système de grilles de télévision.
3. Système (10) suivant l'une quelconque des reven-

dications précédentes, dans lequel le moyen de réception comprend un récepteur infrarouge (34).

4. Système (10) suivant l'une quelconque des revendications précédentes, dans lequel un moyen est prévu pour supprimer des commandes de modification de canal d'enregistreur vidéo pendant l'enregistrement du programme sélectionné, pour de ce fait conserver l'enregistreur vidéo (14) accordé sur le canal sur lequel le programme de télévision sélectionné est fourni. 5
5. Système (10) suivant l'une quelconque des revendications précédentes, dans lequel le moyen pour transmettre automatiquement la commande d'accord de canal au décodeur TV (12) ou à l'enregistreur vidéo (14) à l'heure d'activation et le moyen pour fournir automatiquement des commandes d'enregistrement à l'enregistreur vidéo (14) à ladite heure d'activation comprennent un microprocesseur (36). 10 15 20
6. Système (10) suivant la revendication 5, dans lequel l'enregistreur vidéo (19) comporte un indicateur de canal et ledit microprocesseur est configuré pour afficher un canal sur ledit indicateur de canal correspondant aux commandes d'accord de canal transmises audit décodeur TV (12) ou à l'enregistreur vidéo (14). 25 30
7. Système (10) suivant l'une quelconque des revendications précédentes, dans lequel le moyen pour transmettre automatiquement la commande d'accord de canal au décodeur TV (12) ou à l'enregistreur vidéo (14) à l'heure d'activation comprend un émetteur infrarouge. 35
8. Système (10) suivant l'une quelconque des revendications précédentes, comprenant un moyen d'accord programmable (26) pour recevoir un canal sélectionné sur un canal fixe du décodeur TV (12) et pour accorder sur un signal de télévision souhaité lorsque le canal de télévision sélectionné n'est pas fourni par le biais du décodeur TV (12). 40 45
9. Système (10) suivant la revendication 8, dans lequel l'émulateur (22) fournit des commandes d'accord de canal de télévision au moyen d'accord programmable (26) lorsque le canal de télévision sélectionné n'est pas fourni par le biais du décodeur TV (12). 50
10. Système (10) suivant l'une quelconque des revendications précédentes, dans lequel l'enregistreur vidéo (14) est un magnétoscope à cassettes. 55
11. Procédé pour l'enregistrement sans surveillance de programmes de télévision sur un enregistreur vidéo

(14), l'enregistreur vidéo (14) étant propre à recevoir des signaux de télévision d'un décodeur TV (12), le procédé comprenant les étapes visant à :

recevoir une entrée utilisateur indicative d'un programme de télévision sélectionné sur un canal de télévision à enregistrer à une heure d'activation ;
émuler ledit canal du programme de télévision sélectionné pour produire une commande d'accord de canal reconnaissable par le décodeur TV (12) ou l'enregistreur vidéo (14) ;
mémoriser les commandes d'accord de canal et l'heure d'activation souhaitée ;
transmettre la commande d'accord de canal au décodeur TV (12) ou à l'enregistreur vidéo (14) à l'heure d'activation, et
fournir automatiquement des commandes d'enregistrement à l'enregistreur vidéo (14) à ladite heure d'activation.

12. Procédé suivant la revendication 11, dans lequel ladite étape de réception d'une entrée utilisateur comprend l'utilisation d'un système de grilles de télévision.
13. Procédé suivant la revendication 11 ou 12, comprenant en outre la suppression de commandes de modification de canal d'enregistreur vidéo pendant l'enregistrement du programme sélectionné, pour de ce fait conserver l'enregistreur vidéo (14) accordé sur le canal sur lequel le programme de télévision sélectionné est fourni.
14. Procédé suivant l'une quelconque des revendications 11 à 13, dans lequel les étapes de transmission de la commande d'accord de canal au décodeur TV (12) ou à l'enregistreur vidéo (14) à l'heure d'activation et de fourniture de commandes d'enregistrement à l'enregistreur vidéo (14) à ladite heure d'activation sont exécutées à l'aide d'un microprocesseur (36).
15. Procédé suivant la revendication 14, impliquant l'affichage d'un canal sur un indicateur de canal de l'enregistreur vidéo (14), le canal correspondant aux commandes d'accord de canal transmises audit décodeur TV (12) ou à l'enregistreur vidéo (14).
16. Procédé suivant l'une quelconque des revendications 11 à 15, dans lequel l'étape de transmission automatique de la commande d'accord de canal au décodeur TV (12) ou à l'enregistreur vidéo (14) à l'heure d'activation comprend la transmission d'un signal infrarouge au décodeur TV (12) ou à l'enregistreur vidéo (14).

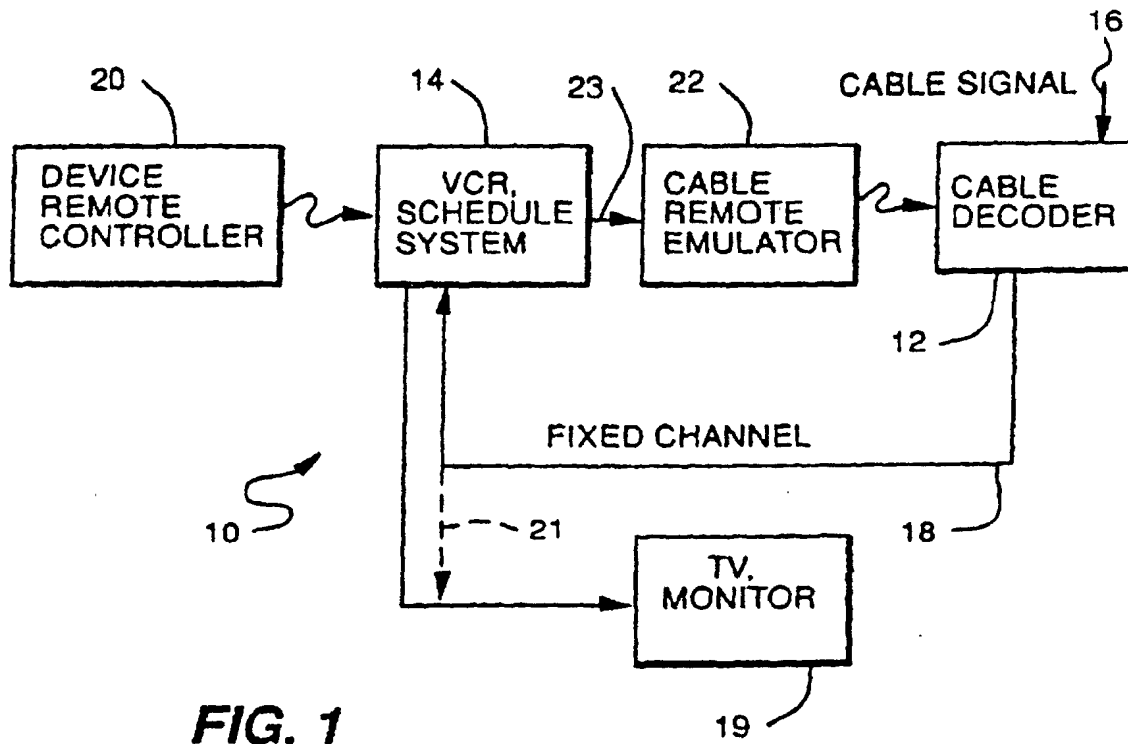

FIG. 1

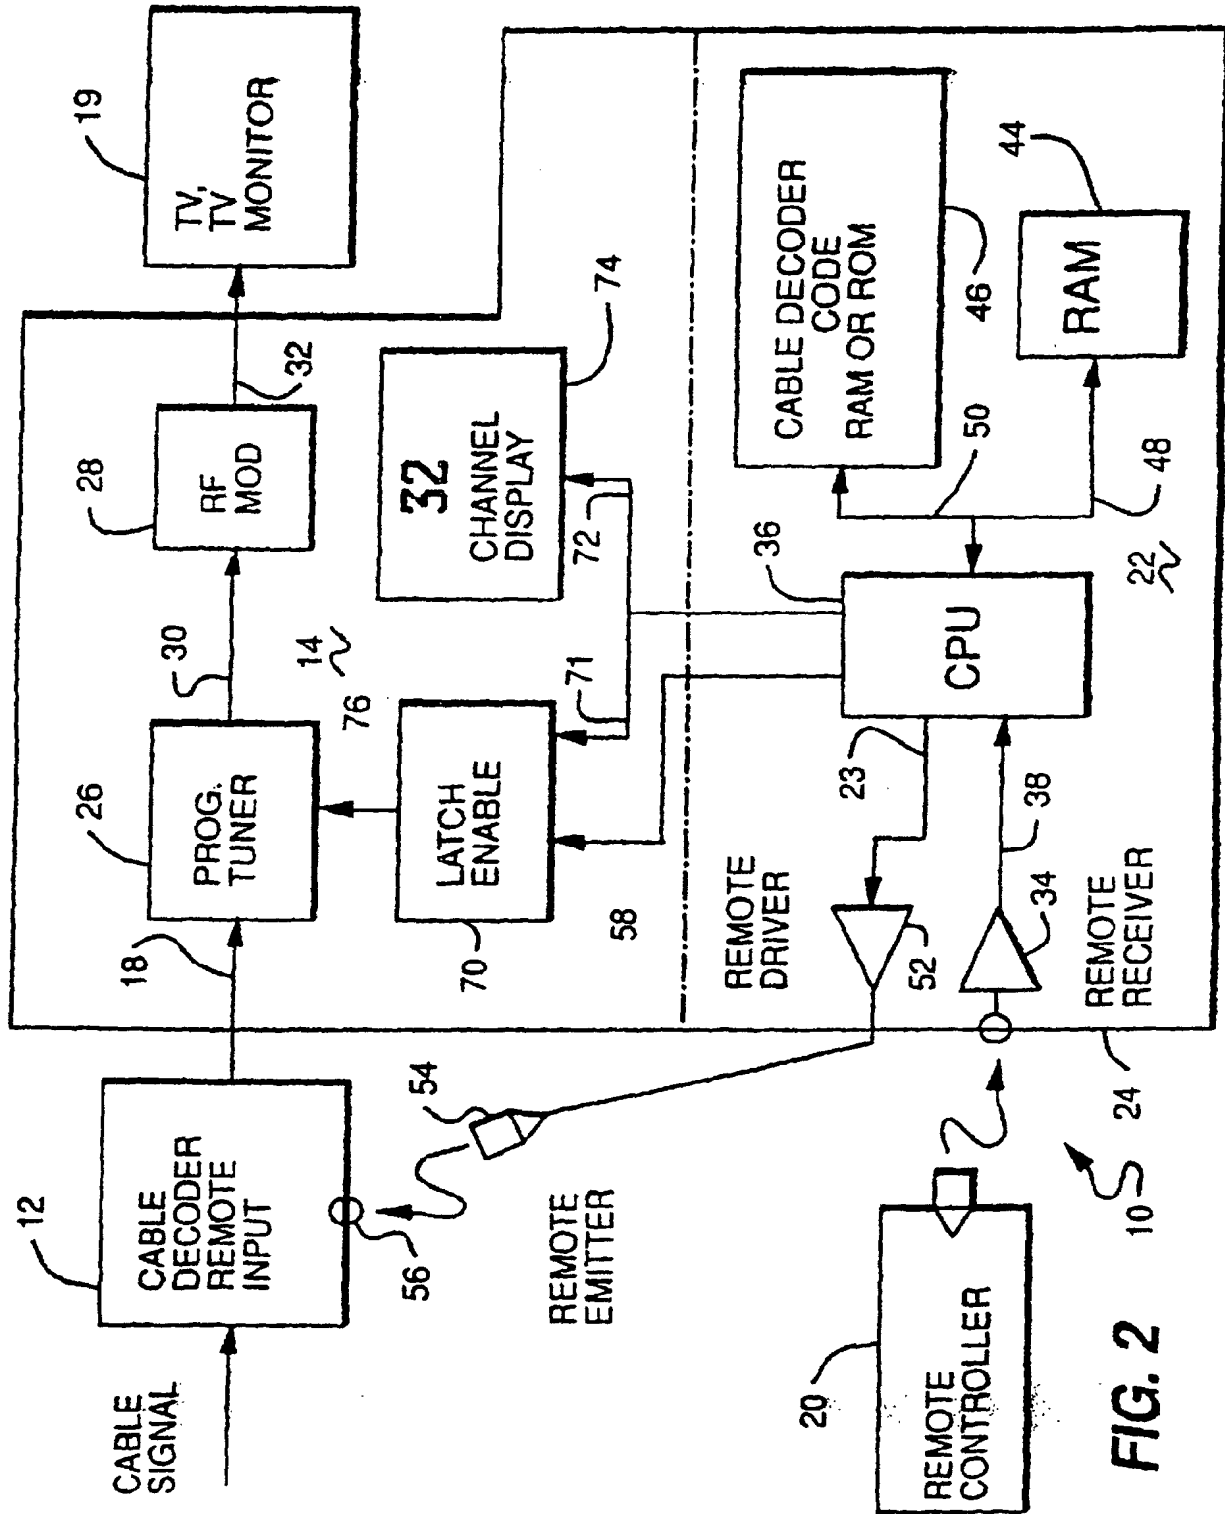

FIG. 2
